

HARNISHA HILL. AE 70.

The sampling of stream sediments in this area is now complete and we are currently awaiting the results of analyses. This work constitutes part of a pilot geochemical survey of our main licence area. The samples, taken at intervals of 0.4 miles along all streams in the area, are dried and the -80 mesh fraction analysed for  $\text{Cu}$ ,  $\text{Pb}$  and  $\text{Zn}$ . Analyses are carried out by A.A.S. at the Alusuisse laboratories near Zurich.

The Geophysical survey, carried out on our behalf by the University of Leeds, has been completed and a photocopy of the final report is enclosed.

The recommendations in the report suggest further work and, as part of the follow-up, detailed geochemical sampling of the area is envisaged in the Spring and Summer of 1973.
